PROFESSIONAL SUMMARY

Early-career full-stack developer with hands-on production experience building Python backend systems, API integrations, data pipelines, internal web applications, client-facing websites, CLI tools, and desktop automation for financial, accounting, and insurance operations.

Alongside day-to-day software delivery, I contribute to LLM training and evaluation work through Outlier and use modern developer tooling to move faster in research, debugging, documentation, and implementation. I am strongest in Python and backend engineering, while also building with Node.js, Next.js, JavaScript, SQL, and production deployment environments.

I am looking to grow inside a strong engineering team where I can keep shipping reliable software, deepen my full-stack and DevOps skills, and help build useful products and practical automation for real business problems.

CORE STRENGTHS

- Full-stack development across Python, JavaScript, Node.js, Next.js, SQL, and web UIs
 - Backend API design, integration, and workflow automation
 - Internal tools, CLI applications, desktop automation, and Excel-centric workflows
 - Practical use of developer tooling, LLM evaluation, prompt refinement, and workflow automation
 - Production support, Linux deployments, Apache, mod_wsgi, environment configuration, and debugging
 - Data-heavy systems for finance, insurance, reconciliation, reporting, and document processing
-

EXPERIENCE

Backend Developer

LCPT Sistemas I - Rio de Janeiro

Oct 2024 - Present

Build and maintain production systems used in financial and insurance operations, with ownership across architecture, development, deployment, debugging, and long-term support.

- Develop backend services, internal web applications, CLI tools, and desktop utilities that automate premium calculations, reporting workflows, document processing, and data reconciliation.
- Integrate internal CRUD platforms with external insurer APIs and business-specific rules.
- Deploy and maintain Flask applications on Linux using Apache, mod_wsgi, Microsoft SQL Server, and supporting infrastructure configuration.
- Build and maintain client-facing web pipelines, including Node.js and Flask applications connected through production Apache, NAT, DNS, and cPanel setup.
- Build data pipelines that transform PDFs, bank statements, and financial records into structured datasets for accounting and operational use.
- Deliver custom accounting software that converts portfolio statements and Excel inputs into structured client-ready workbooks.
- Support production issues, adapt systems to changing client requirements, and keep critical workflows stable over time.

LLM Trainer and Evaluator

Outlier - Concurrent contract work

Contribute to LLM training and quality improvement work while continuing software delivery in production environments.

- Review model outputs for quality, reasoning, instruction-following, and factual consistency.
- Help improve prompt quality and evaluation rigor across varied tasks and edge cases.
- Strengthen practical understanding of how language models behave in real workflows, including where deterministic engineering and human review still matter.
- Apply this experience to faster iteration, clearer prompt design, and more reliable automation decisions.

SELECTED SYSTEMS

Insurance Premium Automation Platform

- Built Python services that extract, validate, normalize, and route data across insurer-specific API workflows.
- Supported automated calculation pipelines and standardized Excel reporting for client delivery.
- Maintain the platform in production as external rules and integrations change.

Financial Data Automation Platform

- Built Flask applications for accounting and finance teams, backed by Microsoft SQL Server.
- Delivered secure Linux-hosted web tools for filtering, validating, and exporting operational data.
- Supported deployment configuration, maintenance, and production troubleshooting.

Client Acquisition and Interactive Avatar Web Pipeline

- Built and launched c1.lcpt.com.br, a static Node.js website used to attract clients through interactive content including a workflow simulator, ROI calculator, and call-to-action entry into the product flow.
- Built and maintain c2.lcpt.com.br, a Flask application connected to the main site, providing login, registration, and gated access to the consultora avatar experience.
- Configured Apache, NAT, DNS, and cPanel to publish, connect, and keep both applications running in production.
- Continue maintaining the full pipeline, including deployment updates, connectivity, and operational reliability.

Portfolio PDF to Excel Automation Platform

- Built a production Python application for an accounting firm's client that converts UBS-style portfolio statements from PDF into structured Excel workbooks.
- Implemented resilient extraction workflows using Camelot, Tabula, pdfplumber, and Google Document AI OCR fallback for hard-to-parse statements.
- Generated audit-friendly outputs including per-account workbook tabs, summary sheets, diagnostics, and JSON run reports for downstream validation.
- Designed the CLI workflow for single-file and batch execution, making it suitable for repeated operational automation.

Cashflow Desktop Application

- Built a Windows desktop application in Python and PySide6 for an accounting client, turning one or more Excel inputs into a monthly cashflow workbook in Brazilian Portuguese.
- Implemented background processing with QThread so the UI remains responsive during file transformation and workbook generation.
- Added robust Excel ingestion, monthly dropdown automation, formula-driven movement mapping, and packaged build workflows for local deployment.

Document Processing and Reconciliation Workflows

- Developed pipelines that convert non-searchable financial documents into structured, machine-readable data.
- Built normalization logic for more than **70 bank statement layouts**.
- Implemented deterministic matching and BM25-based fuzzy matching to support auditable reconciliation.

Retrieval and Search Systems

- Built search and indexing pipelines using crawling, tokenization, inverted indexes, TF-IDF, cosine similarity, and SQLite-backed retrieval.
- Applied information retrieval concepts to document-heavy business workflows and confidential client work.

TECHNICAL SKILLS

Languages

Python, JavaScript, SQL, PHP

Full-Stack and Backend

Flask, SQLAlchemy, Node.js, Next.js, REST APIs, server-rendered web applications, CRUD systems, Typer

Frontend and UI

HTML, CSS, Tailwind CSS, Bootstrap, responsive interfaces

Data and Automation

Pandas, OpenPyXL, PDF extraction, OCR, Google Document AI, Excel report generation, workflow automation, data normalization

Desktop and Client Tooling

PySide6, QThread, Windows desktop applications, localized business tooling

LLM and Automation

LLM evaluation, prompt refinement, workflow automation, development tooling

Databases

Microsoft SQL Server, MySQL, SQLite

Platforms

Linux, Windows, macOS

Infrastructure and DevOps

Apache2, mod_wsgi, SSL/TLS, DNS, NAT, cPanel, environment setup, deployment support, GitHub Pages

EDUCATION

Bachelor of Science in Computer Science
University of the People - Pasadena, USA
2022 - 2026 (In Progress)

TRAINING

- AI Fluency Framework and Foundations - Anthropic
 - Website Development with Python and Flask - Alison
 - SQL for Beginners - Alison
 - Data Analysis with Excel - Codecademy
 - Front End Development (CSS) - Great Learning
 - Learn to Program: The Fundamentals - Coursera
-

LANGUAGES

English
Portuguese
