

I am pleased to recommend Ananda Moreira, who has been working with me at LCPT Sistemas e Servicos de Informatica as a Backend Developer focused on automation systems and production software.

Since joining our team, Ananda has taken ownership of multiple systems that are actively used in financial and insurance operations. His work is not limited to development tasks - he is involved across the full lifecycle of the software, including architecture decisions, backend implementation, deployment, and ongoing production support.

Ananda has designed and maintained a Python-based automation platform that integrates with multiple insurer APIs to perform insurance premium calculations and generate standardized Excel reports for clients. This system operates under real business constraints, requiring careful handling of data normalization, validation, and evolving external integrations.

He has also developed and maintained internal financial systems built with Flask and SQL databases, deployed on Linux environments using Apache and mod_wsgi. These systems are used by accounting teams to access, filter, and export operational data securely and reliably.

In addition to backend platforms, Ananda has built robust data processing pipelines for document-heavy workflows. His work includes converting non-searchable PDF portfolios into structured datasets, implementing normalization across dozens of banking formats, and developing reconciliation tools using deterministic logic combined with BM25-based fuzzy matching. These systems are designed for auditability and are used in real financial processes.

Another notable contribution is a production document automation platform that converts complex financial portfolio statements into structured Excel workbooks. This required integrating multiple extraction techniques, including PDF parsing libraries and OCR fallback strategies, while maintaining reliability across varied input formats.

Ananda has also contributed to building client-facing web systems, including Node.js and Flask applications connected through production infrastructure involving Apache, DNS, NAT, and cPanel configuration. He has demonstrated the ability to work across both backend logic and deployment environments.

From a technical standpoint, he is strong in Python, backend system design, API integrations, data pipelines, and Linux-based deployments. He works comfortably with SQL databases, document processing workflows, and production debugging. His experience also extends into information retrieval systems, where he has implemented indexing and ranking pipelines using techniques such as TF-IDF and cosine similarity.

Beyond his technical capabilities, Ananda is reliable, consistent, and capable of working independently on systems that require long-term maintenance and stability. He understands the importance of correctness in production environments and approaches problems with a practical and structured mindset.

I am confident that Ananda will be a strong asset to any engineering team, particularly in roles involving backend systems, automation platforms, and data-driven applications.

Sincerely, Luis Cesar Pinheiro Owner LCPT Sistemas e Servicos de Informatica
