Professional Summary

Full-stack engineer with experience designing, building, and operating production systems end-to-end as a sole developer. Focused on automation platforms, financial data pipelines, and API-driven systems combining deterministic logic with modern AI workflows.

Delivered real systems used in finance and insurance environments, including document processing pipelines, API integrations, and dashboard applications. Systems are actively used in production with sustained stability and minimal maintenance.

Looking to join a collaborative engineering team to deepen experience in scalable systems, architecture patterns, and peer-reviewed development.

Technical Skills

Backend

Python, Flask, Node.js

Frontend

JavaScript, TypeScript, Next.js, HTML, CSS

Data and AI

Pandas, OCR (Tesseract), Retrieval Systems, TF-IDF, RAG, PDF processing

Databases

MySQL, SQL Server, SQLite

Infrastructure

Linux, Apache, mod_wsgi, Docker, AWS

Engineering

Git branching, CLI tools, logging, validation pipelines, production debugging

Tooling

Pytest, Ruff, OpenPyXL, pdfplumber, Camelot, Tabula

Experience

Full Stack Engineer (Sole Developer)

LCPT Sistemas — Brazil | Oct 2024 – Present

Responsible for architecture, development, deployment, and maintenance of multiple production systems in finance and insurance domains.

Built and maintained end-to-end pipelines integrating data ingestion, validation, API processing, reporting, and user interfaces.

Developed systems used by accountants and business users in real operational workflows, with sustained production stability and minimal maintenance over extended periods.

Collaborated directly with accounting stakeholders to translate financial workflows into automated and auditable systems.

Managed infrastructure and deployments using Linux, Apache, and mod_wsgi, including production debugging and system updates.

Insurance Premium Automation Platform

Designed and implemented a system integrating internal CRUD applications with external insurance APIs for premium calculation.

Built ingestion and normalization pipelines to handle insurer-specific responses and changing API contracts.

Implemented a status-driven workflow to ensure reliable processing, reprocessing, and auditability of requests.

Developed reporting pipelines generating standardized Excel outputs for business use.

Financial Data and Document Automation Systems

Built document processing pipelines converting PDF financial statements into structured Excel outputs.

Developed support for multiple bank formats using deterministic parsing combined with OCR fallback.

Engineered reconciliation systems using rule-based logic and fuzzy matching to validate financial data.

Generated auditable outputs highlighting matched and unmatched records for accounting workflows.

Bank Statement Conversion Platform

Designed and deployed a web application standardizing file intake and naming for accounting operations.

Integrated metadata-driven workflows to enforce consistency and reduce human error.

Implemented deterministic file renaming and validation logic.

Deployed using Apache and mod_wsgi, supporting real-world usage for over one year.

Insurance Dashboard and Data Systems

Built Flask-based dashboard applications for viewing and exporting calculation results.

Implemented bulk Excel ingestion, inline editing, and API synchronization workflows.

Separated ingestion, processing, and visualization layers for maintainability.

Delivered interfaces designed for accountant workflows with clear status tracking and audit visibility.

Company Website and Backend Services

Rebuilt and deployed company website with integrated backend services.

Implemented APIs for form handling, session tracking, and client-side logging.

Developed logging pipelines to capture frontend errors and user activity.

Integrated multiple applications into a single production environment.

Projects

Local-First AI RAG Platform

Built a document-centric system with ingestion, chunking, embedding, and retrieval workflows.
Implemented backend-controlled logic ensuring traceability, validation, and controlled model interaction.
Designed hybrid retrieval combining exact-term search and semantic search.

Information Retrieval Engine

Developed a full pipeline including crawling, indexing, and ranked retrieval using TF-IDF and cosine similarity.
Built a persistent inverted index using SQLite.
Implemented query processing with vector-space ranking.

OCR and Document Processing Tools

Built command-line systems for batch OCR processing of PDFs.
Implemented logging, error handling, and configurable pipelines.
Designed tools to handle non-searchable financial documents reliably.

Cashflow Desktop Application

Developed a Python desktop application for financial data processing.
Implemented background processing to maintain a responsive interface.
Generated structured monthly reports from raw accounting inputs.

Education, Certifications, and Additional Information

Bachelor of Science in Computer Science, Magna Cum Laude

University of the People — 2026

AI Fluency Framework and Foundations — Anthropic

Node.js (Intermediate) — HackerRank

Python-Flask Diploma — Alison

SQL for Beginners — Alison

Additional Information

Raised in India and educated in an English-language academic system.
Lived in Hong Kong for 6 years.
Native-level English proficiency.
Cross-cultural communication experience.
Early exposure to system-level thinking contributing to building robust and auditable systems.
